

Summarized Key Findings and Power BI dynamic Data update

Key Findings from Our Pizza Sales Analysis:

- **"Classic" and "Supreme" Pizzas Drive the Majority of the Revenue:** The top two pizza categories, "Classic" and "Supreme," together account for over half (**52.37%**) of the total revenue, bringing in nearly **\$430K**. This clearly indicates these are the core offerings and should remain a focus in the menu and marketing strategies.
- **Lunchtime is the Busiest Period for Orders:** The data reveals a significant peak in order volume around midday, with 12 PM and 1 PM being the absolute busiest hours, collectively seeing nearly 5,000 orders. This highlights the importance of efficient operations and adequate staffing during the lunch rush.
- **Chicken-Based Pizzas Dominate Top Revenue Earners:** The "Thai Chicken," "Barbecue Chicken," and "California Chicken" pizzas are our top three revenue generators. Each contributing over \$40K, these chicken-centric options are exceptionally popular and are key to our overall sales success.

Power BI Refresh & Deployment Strategy

- **Move data to a reliable source:** Instead of static local files, I would place the data where Power BI Service can reach it directly, e.g., a cloud location like SharePoint Online/Azure Blob or, preferably, a database such as Azure SQL Database (or an on-prem SQL Server if you have existing infrastructure). I would ensure that new orders and pizza info get written there in the same schema.
- **Publish to Power BI Service :** From Power BI Desktop, I would publish the .pbix to a workspace in Power BI Service. This lifts both the report and its underlying dataset to the cloud.
- **Configure Scheduled Refresh:** In Power BI Service, I would go to Dataset settings and set up Scheduled Refresh at the interval you need (daily, or every few hours during peak operations). I would point the dataset to the cloud/storage or database you prepared.
- **Set up On-premises Data Gateway if needed:** If my source is on-premises (e.g., a local SQL Server), I would install and configure the Power BI On-premises Data Gateway so that the Service can securely pull the latest data without manual export.

With this setup, whenever new pizza orders come in, Power BI Service will pick them up automatically on each scheduled refresh, and the dashboard visuals and cards will always reflect the freshest data, no manual rebuilding needed.
